

HAVE YOU SEEN A TAGGED VULTURE?

Cathy Hue

VULTURES UNDER THREAT

Vultures are critical to healthy ecosystems. And yet across the world vulture populations are in rapid decline. Eleven vulture species occupy ranges in Africa, seven of which are categorised as Endangered or Critically Endangered. Declines in vulture populations have devastating impacts on ecosystems as well as social and economic health, including increased disease transmissions in both wildlife and humans. A number of factors have contributed to Africa's vulture decline, the foremost of which is poisoning and human persecution.

NEW RESEARCH PROJECT

Lilongwe Wildlife Trust's 'Conserving Malawi's Vultures' project works with partners to develop Malawi's first-ever vulture conservation initiatives. As part of this project we have tagged a number of vultures in order to track their movements and understand how they are using the landscape.

REPORTING A TAGGED VULTURE

If you see a vulture with a wing tag please note:

- Number and colour of wing tag
- Date and time of sighting
- Location (please be as specific as possible)

Then submit the details to:

research@lilongwewildlife.org or
www.projectvulture.org.za/report-vulture-sighting

www.lilongwewildlife.org/conserving-malawis-vultures
